

YAML Terms for GitHub Actions

Workflow Syntax

Work flow triggers are events that cause a workflow to run:

- Events that occur in your workflow's repository
- Events that occur outside of GitHub and trigger a `repository_dispatch` event on GitHub
- Scheduled times
- Manual

`name` : The name of the GitHub Action

`on` : When or condition of when the workflow is triggered. There are different filters, branches, labels, that can be used to trigger the workflow.

`jobs` : A jobs runs in a runner environment as determined by `runs-on`

Course Notes

Workflow Components

Actions: Reusable tasks that perform specific jobs within a workflow

Workflows: Automated processes defined in your repository that coordinate one or more jobs, triggered by events or on a schedule

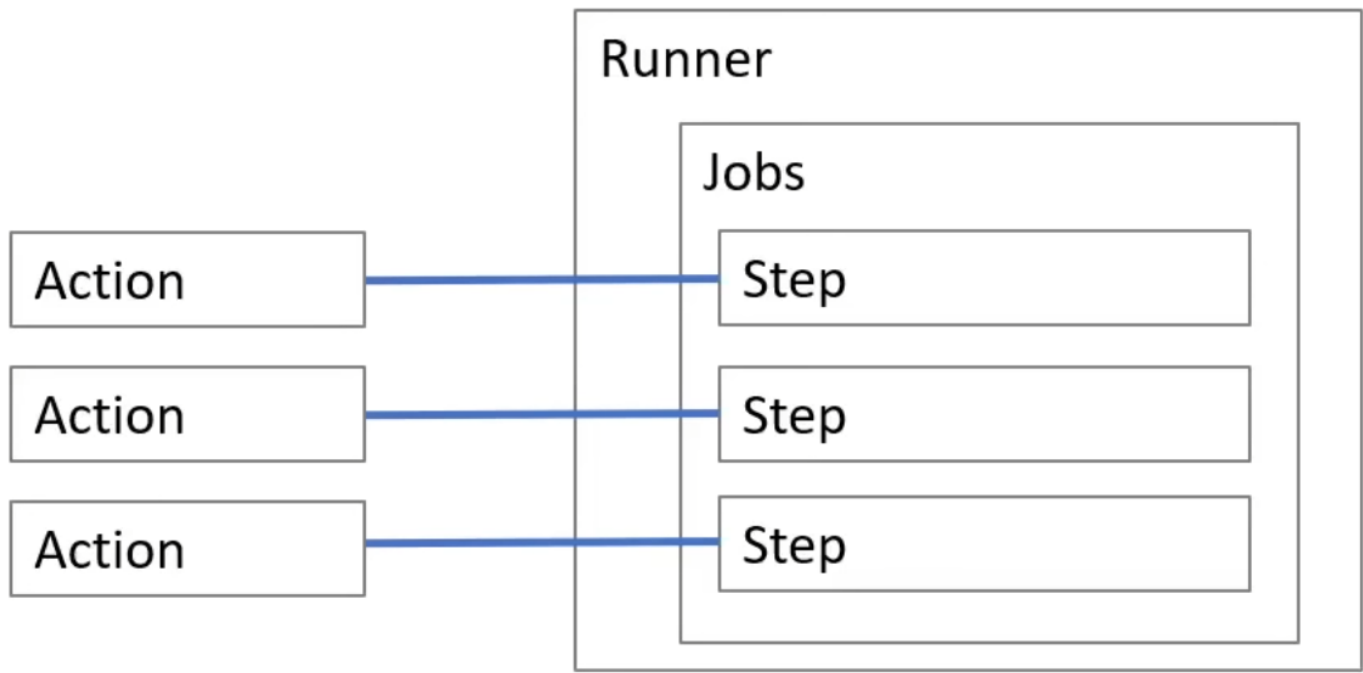

Jobs: Groups of steps that execute on the same runner, typically running in parallel unless configured otherwise

Steps: Individual tasks within a job that run commands or actions sequentially

Runs: Instances of workflow execution triggered by events, representing the complete run-through of a workflow

Runners: Servers that host the environment where the jobs are executed, available as GitHub-hosted or self-hosted options

Marketplace: A platform to find and share reusable actions

Scheduling Events

Schedule can use a **cron expression** to trigger a workflow at a specific time or day

For example:

```
on:
  schedule:
    - cron: '30 5 * * 1,3'
    - cron: '30 5 * * 2,4'

jobs:
  test_schedule:
    runs-on: ubuntu-latest
    steps:
      - name: Not on Monday or Wednesday
        if: github.event.schedule != '30 5 * * 1,3'
        run: echo "Skip this step on Monday and Wednesday"
      - name: Every time
        run: echo "This step will always run"
```

Triggering Single or Multiple Events

Single Event

For example on **Push**

```

name: CI on Push

on:
  push:
    branches:
      - main

jobs:
  build:
    runs-on: ubuntu-latest
    steps:
      - uses: actions/checkout@v2
      - name: Run a one-line script
        run: echo "Hello world!"

```

Multiple Events

For example on **Push, Pull, Request, Release**

Note: If you specify multiple events, only one of those events needs to occur to trigger your workflow. If multiple triggering events for your workflow occur at the same time, multiple workflow runs will be triggered

```

name: CI on Multiple Events

on:
  push:
    branches:
      - main
  pull_request:
    branches:
      - main
  release:
    types: [published, created]

jobs:
  build-and-test:
    runs-on: ubuntu-latest
    steps:
      - uses: actions/checkout@v2
      - name: Set up Python

```
